Contents

	Preface	xi
1	**Introduction**	1
1.1	Quantum chromodynamics	1
1.2	The deconfinement/chiral transition	4
	1 The bag model	4
	2 Lattice quantum chromodynamics	7
1.3	Heavy ion collisions	11
	References and further reading	16
	Exercises	17
2	**Quantum statistical mechanics**	18
2.1	Path integral formalism and imaginary time	19
2.2	Operator formalism	24
2.3	The spectral function $\rho(k_0)$	25
2.4	The Matsubara (or imaginary-time) propagator	27
2.5	The time-ordered propagator	28
2.6	Frequency sums	29
	References and further reading	32
	Exercises	32
3	**The scalar field at finite temperature**	35
3.1	The neutral scalar field	35
	1 Wick's theorem and the propagator	36
	2 First-order corrections: propagator and partition function	39
	3 Feynman rules	43
3.2	The charged scalar field	44
3.3	Real-time formalism	47
	1 Path integrals	47

Published online by Cambridge University Press

	2 Integration path and propagators	50
	3 Feynman rules with the symmetric propagator	54
3.4	The self-energy in the real-time formalism	55
3.5	Renormalization at non-zero temperature	58
	References and further reading	60
	Exercises	60
4	**Simple applications of perturbation theory**	62
4.1	Ring diagrams in the φ^4-model	62
4.2	Some one-loop diagrams	65
	1 Self-energy diagram in the imaginary-time formalism	66
	2 Self-energy diagram in the real-time formalism	69
	3 The three-point vertex at one-loop	70
4.3	Cutting rules at finite temperature	72
	1 Derivation of the rules	72
	2 Application to the self-energy	75
4.4	Physical interpretation of discontinuities	77
	1 Production of a weakly interacting massive particle	77
	2 Production of a weakly interacting massless particle	78
	3 General proof	81
	4 Small deviations from equilibrium	83
	References and further reading	85
	Exercises	85
5	**Dirac and gauge fields at finite temperature**	86
5.1	The Dirac field at finite temperature	86
	1 Coherent fermion states and path integrals	86
	2 Quantization of the Dirac field	90
	3 Frequency sums	93
	4 Non-zero chemical potential	95
5.2	Quantization of gauge fields at non-zero temperature	97
	1 The partition function	98
	2 The gauge boson propagator in linear gauges	102
	3 The gauge boson propagator at non-zero temperature	106
5.3	Real photon and lepton pair production	108
	1 Real photon production	109
	2 Lepton pair production	109
	References and further reading	111
	Exercises	111
6	**Collective excitations in a plasma**	114
6.1	Linear response theory	115
6.2	The photon propagator in a QED plasma	118

Published online by Cambridge University Press

1 General form of the photon propagator 118
2 The hard thermal loop approximation for $\Pi_{\mu\nu}$ 119
3 Evaluation of $\Pi_{\mu\nu}$ 121
4 Transverse and longitudinal photons 123
6.3 Debye screening and plasma oscillations 124
1 Linear response and Debye screening 124
2 Plasma oscillations 127
3 Sum rules and residues 129
4 Non-zero chemical potential 133
6.4 Kinetic derivation of the photon self-energy 134
6.5 The electron propagator in a QED plasma 138
1 Evaluation of Σ 138
2 Quasi-particles 140
6.6 Elementary excitations in a QCD plasma 144
References and further reading 147
Exercises 147

7 Hard thermal loops and resummation 150
7.1 Hard thermal loops in QED 150
1 The three-point function in QED 150
2 The four-point functions in QED 154
3 The effective Lagrangian in QED 156
7.2 The QCD plasma 158
1 The three-point functions in QCD 158
2 General remarks on hard thermal loops 161
3 Hard thermal loops from Ward identities 163
7.3 The effective expansion 168
1 General theory 168
2 Production of soft dileptons in a quark–gluon plasma 172
3 The gluon damping rate 175
4 Higher-order calculations 178
7.4 Kinetic theory of hard thermal loops 180
References and further reading 188
Exercises 188

8 Dynamical screening 191
8.1 Energy loss of a heavy fermion in a QED plasma 192
8.2 Production of hard real photons from a quark–gluon plasma 199
8.3 Screening and transport phenomena 202
References and further reading 210
Exercises 210

Published online by Cambridge University Press

9 Neutrino emission from stars 212
9.1 The photon dispersion relations revisited 213
9.2 Neutrino emission from photon decay 217
References and further reading 221
Exercises 221

10 Infrared problems at finite temperature 222
10.1 Kinoshita–Lee–Nauenberg theorem in lepton pair production 223
1 The two-loop approximation 225
2 Resummation and infrared safe processes 227
10.2 Transverse gluons in the static limit 229
1 The magnetic mass 229
2 Linde's problem 231
10.3 Soft photon production 232
10.4 Fermion damping rate 235
References and further reading 237
Exercises 238

A Formulary 239

B Operator formalism 244
